The GTGF polypeptides are structurally and functionally related to a family of growth factors which include IGF (Insulin-like growth factor), pDGF (platelet-derived growth factor), and FGF (fibroblast growth factor). CTGF-2 exhibits 89 percent identity and 93 percent similarity to Cry61. Cry61 is a growth factor-inducible immediate early gene initially identified in serum-stimulated mouse fibroblasts. It encodes a member of an emerging family of secreted proteins which are also a group of cysteine-rich proteins. This group of GFs are important for normal growth, differentiation, morphogenesis of the cartilaginous skeleton of an embryo and cell growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            enhance the rewound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Connective tissue growth factor-2 and DNA encoding it - useful enhance the repair of connective and support tissue, and to en

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     baculovirus expression vector, having first been amplified and modified via PCR using primers AAZ11721 and AAZ11722. In another instance, the cDNA was cloned into a COS cell expression vector, with prior amplification and modification using PCR primers AAZ11723 and AAZ11724. CTGF-2 is structurally and functionally related to family of growth factors which include IGF (insulin-like growth factor), PDGF (platelet-derived growth factor) and FGF (fibroblast growth factor). This emerging family of cysteine-rich secreted proteins are important for normal growth, differentiation, morphogenesis of the cartilaginous skeleton of an embryo and cell growth. Their functions also include wound healing, tissue repair, implant fixation and stimulating increased bone mass. CTGF-2 may be used to enhance the repair of connective tissue and con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   support tissue and can therefore treat skin disorders e.g., acne, UV damage or burns. CTGF-2 can be used to promote the attachment, fixation and stabilization of tissue implants inserted during reconstructive surgery, and can be used to enhance the healing of external wounds. It can be used in the treatment of injured or dependence in the promotes the growth of connective tissue, bone and ceme and the statement of the promotes of the growth of connective tissue, bone and ceme and the statement of the growth of connective tissue, bone and ceme and the statement of the growth of connective tissue, bone and ceme and the statement of the growth of connective tissue, bone and ceme and the statement of the statement

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        179
```

The present invention relates to a method for stimulating angiogenesis in a mammal. The method comprises administering a polynucleotide encoding connective tissue growth factor-2 (CTGF-2) or an active fragment or its derivative. The method is useful for stimulating angiogenesis in a mammal preferably human having ischaemia or restenosis or is treated for limb revascularisation which is leg or arm. The invention is useful for inhibiting tumour growth, where angiogenesis is utilised for enhancing the repair of connective and support tissue, promoting the attachment,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          betal. The proteins encoded by hybridising colonies (beta-IG-M1) contain 38 Cys residues and are induced by TGF-betal.

Beta-IG-M2) contain 38 Dys residues and are induced by TGF-betal.

Beta-IG-M1 displays 80 percent homology to the CEF-10 protein

induced by v-src in chicken embryo fibroblasts and is identical

to the protein encoded by cyr61, an immediate early response gene

induced in quiescent BALB 3T3 cells by serum treatment. Residues

49-56 of beta-IG-M1 conform to the GCGCCXXC motif reported in the

amino half of insulin-like growth factor (IGF) binding proteins.

The C-terminal Cys rich region of beta-IG-M1, -M2 and CEF-10 contain

an amino acid sequence with strong homology to a motif found near the

C-terminal of the malarial circumsporozoite (CS) protein, which is

highly conserved among all species of malarial parasites sequenced

to date (designated region II). This motif is also found in

other proteins which have cell adhesive properties that mediate

cell-cell and cell-extracellular matrix interactions, such as

properdin, thrombospondin, and TRAP. The proteins encoded by

TGF-beta induced genes are likely to be involved in mediation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                protein (Fisp12) and connective tissue growth factor (CTGF) and nucleic acid molecules encoding such proteins. The polypeptides of the invention are members of cysteine-rich secreted protein family. Human Cyr61 fragment is useful in methods for screening modulators of cell adhesion, cell migration, fibroblast cell proliferation, angiogenesis, wound healing and Cyr61-integrin interaction. Modulator of Cyr61-integrin alphavbeta3 interaction is used for the preparation of a medicament for the fibrosis, tumour growth, disorders associated with inadequate angiogenesis; aberrant granulation tissue development; aberrant fibroblast growth and wounds. Polynucleotides of the invention are useful in gene therapy. The present sequence is mouse Cyr61
                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                    The invention relates to extracellular matrix (ECM) signalling molecules involved in cellular response to growth factors. More particularly the invention is directed to cysteine-rich protein (Cyr61), and Cyr61-related proteins such as fibroblast secreted (Cyr61).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel human cysteine-rich protein 61 (Cyr61) fragment useful in methods for screening for modulators of cell adhesion, fibroblast cell proliferation, angiogenesis and cell migration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   31-JAN-2000; 2000US-0495448
